

Selective-Disclosure Settlement Infrastructure

Private cross-chain coordination secured by Bitcoin.

Keywords: Bitcoin-native, Atomic settlement, Shielded coordination, Verifiable privacy

Problem

Capital Coordination Is Broken

Current systems expose:

- ★ treasury allocations
- ★ counterparty relationships
- ★ settlement routes
- ★ investment strategies
- ★ liquidity flows

Existing bridges introduce:

- ★ custodial risk
- ★ opaque trust assumptions
- ★ fragmented liquidity
- ★ poor institutional privacy

Core Problem

Cross-chain finance lacks confidential settlement infrastructure.

BCYX PROTOCOL COMPARISON

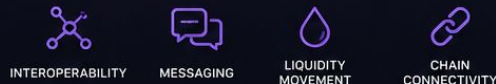

Confidential Settlement Coordination vs. Existing Interoperability Protocols

BCYX

PRIVATE COORDINATION.
PUBLIC VERIFICATION.

FEATURE	 BCYX (Selective-Disclosure Settlement Protocol)	 LAYERZERO (Omnichain Messaging Protocol)	 HYPERLANE (Modular Interoperability Protocol)	 WORMHOLE (Cross-Chain Bridge Protocol)	 CHAINLINK CCIP (Enterprise Interoperability Protocol)	 COSMOS IBC (Inter-Blockchain Communication Protocol)
 Main Focus	Confidential settlement coordination	Omnichain messaging	Modular interoperability	Cross-chain bridge & messaging	Enterprise cross-chain interoperability	Native chain interoperability
 Bitcoin-Native Orientation	Strong	Weak	Weak	Weak	Moderate	None
 Selective Disclosure / Privacy	Native	No	No	No	Partial / Compliance-Oriented	No
 Shielded Settlement Pools	Yes	No	No	No	No	No
 Atomic Private Coordination	Yes	Partial	Partial	Partial	Partial	Limited
 ZK-Native Architecture	Core Design	Optional	Optional	Minimal	Minimal	Minimal
 Institutional Treasury Privacy	Strong	Weak	Weak	Weak	Moderate	Weak
 Verification Model	BitVMX + ZK + Taproot	DVNs (Decentralized Verifier Networks)	ISMs (Interchain Security Modules)	Guardians (Multisig Validators)	DON + RMN (Decentralized Oracle Network + Risk Mgmt)	Light Clients (Tendermint / ICS)
 Messaging Layer Role	Secondary	Core	Core	Core	Core	Core
 Generalized Bridging	Not Primary Goal	Strong	Strong	Strong	Strong	Cosmos Ecosystem Only
 Regulatory Selective Disclosure	Native	No	No	No	Partial	No
 Cross-Chain Investment Settlement	Core Use Case	Not Specialized	Not Specialized	Not Specialized	Partial	No
 Privacy-Preserving RWA Routing	Strong	Weak	Weak	Weak	Moderate	Weak

EXISTING PROTOCOLS OPTIMIZE FOR:

OPTIMIZES FOR:
**CONFIDENTIAL SETTLEMENT
COORDINATION**

BCYX UNIQUE ADVANTAGE:

Market Shift

Bitcoin Is Becoming Settlement Infrastructure

Converging Trends

- ★ Bitcoin treasury adoption
- ★ tokenized RWAs
- ★ institutional DeFi
- ★ BitVM ecosystem
- ★ ZK maturity
- ★ demand for selective disclosure

Opportunity

Bitcoin-secured confidential capital markets.

Solution

What is BCYX?

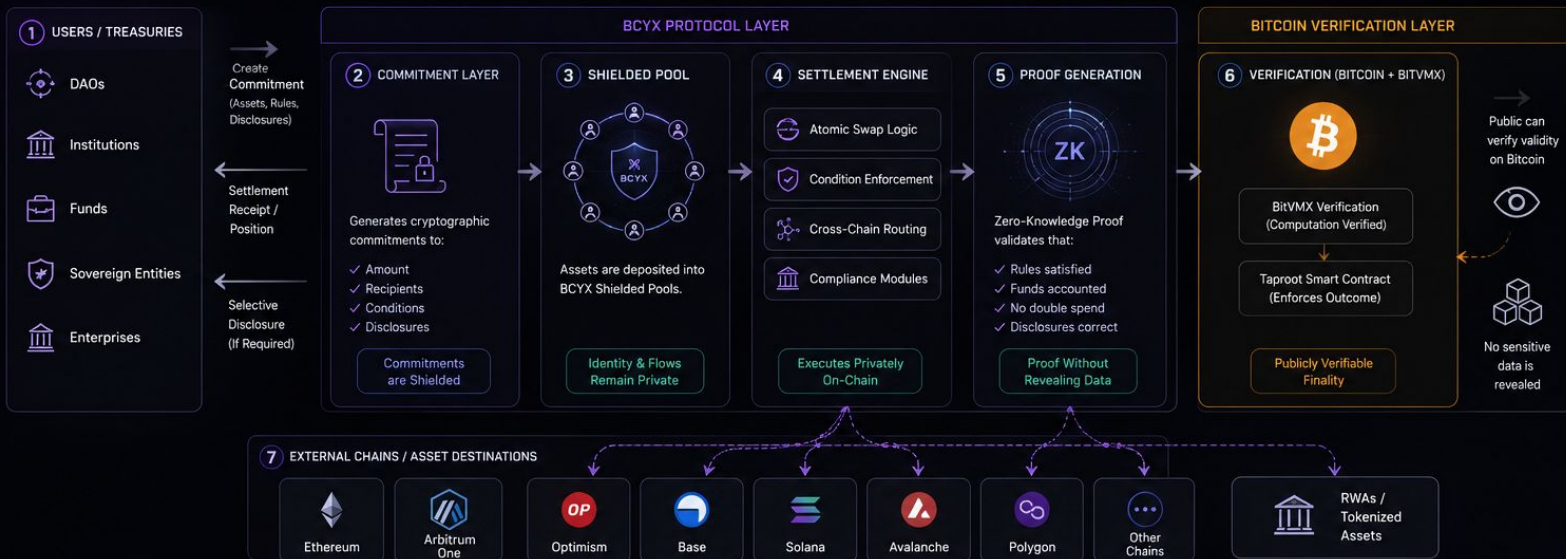

BCYX is a selective-disclosure
cross-chain settlement protocol
for confidential capital coordination.

BCYX Enables

- ★ private settlement
- ★ programmable disclosure
- ★ shielded ownership
- ★ atomic investment routing
- ★ Bitcoin-secured coordination

Core Components

- ★ Taproot
- ★ adaptor signatures
- ★ zk proofs
- ★ commitments
- ★ nullifiers
- ★ shielded pools
- ★ selective disclosure engine

HOW BCYX WORKS

THE BCYX DIFFERENCE

- Not a Bridge.** A confidential settlement coordination layer.
- Privacy by Design.** Selective disclosure built in, not added on.
- Bitcoin at the Core.** Leverages Bitcoin security and BitVMX verification.
- Institutional Ready.** Built for real-world capital and compliance needs.
- Future Proof.** Modular architecture for an open financial future.

How it works

Atomic Selective-Disclosure Settlement

TX Lifecycle

1

Treasury creates private commitment

2

Bitcoin locks atomically

3

Compliance verified privately

4

ZK settlement proof generated

5

Cross-chain investment settles

6

Ownership remains shielded

Privacy Model

What BCYX hides

Hidden

Investor
identity

Allocation
strategy

Counterparties

Ownership graph

Internal routing

Public

Settlement
validity

Proof verification

Finality

Chain state

Pool integrity

Key Insight

Public verification.

Private coordination.

Use cases

Initial Markets

Institutional Treasury Routing

- ★ DAOs
- ★ Bitcoin treasuries
- ★ sovereign reserves

Regulated Investments

- ★ tokenized funds
- ★ private credit
- ★ structured products

Bitcoin Interoperability

- ★ Bitcoin ↔ EVM
- ★ Bitcoin ↔ rollups
- ★ Bitcoin ↔ settlement layers

Confidential RWA Markets

- ★ shielded allocations
- ★ selective disclosures
- ★ private ownership structures

Why BCYX

Positioning

BCYX Is NOT

- ★ a bridge
- ★ a mixer
- ★ another rollup
- ★ another VM
- ★ another exchange

BCYX IS

Confidential settlement coordination infrastructure.

Strategic Layer

BCYX leverages:

- ★ Bitcoin security
- ★ BitVM verification
- ★ ZK privacy systems

without competing at the VM layer.

Long Term Vision

The Future of Capital Coordination

BCYX Evolves Into

- ★ confidential settlement fabric
- ★ Bitcoin-native financial coordination layer
- ★ privacy-preserving RWA infrastructure
- ★ sovereign settlement rails
- ★ programmable capital markets

BCYX

Private coordination.
Public verification.
Bitcoin settlement.

Vision Statement

BCYX enables confidential
cross-chain capital coordination
secured by Bitcoin.
